Pipevine Swallowtail (*Battus philenor*). Orange, blue and white markings on its underwings help identify the Pipevine Swallowtail. It lays its rust-colored eggs on pipevines and related plants, upon which the caterpillar feeds when it emerges. As with Monarch butterflies and

milkweed, the pipevines contain a substance that gives Pipevine Swallowtails an unpleasant flavor to birds. The adults feed on a broad variety of plants. Found in most of the United States, as well as Mexico.
